

Push local changes to GitHub

This guide covers the Fortiva desktop app repository (ICITPROJ/Fortiva). All commands run in PowerShell from your project folder.

The workflow (overview)

Edit code on your PC -> commit -> push to GitHub -> (optional) tag -> CI builds release

GitHub only receives what you commit and push. The installed app updates only after a successful GitHub Release (tag).

Step 0 - Open the project folder

```
cd C:\Repo\Github\Fortiva
```

Step 1 - See what changed

```
git status
```

Optional - view diffs:

```
git diff
```

Step 2 - Stage files to push

Stage everything:

```
git add -A
```

Or stage one file:

```
git add src\Fortiva.AppHost\Pages\SettingsPage.xaml.cs
```

Step 3 - Commit (snapshot on your PC)

```
git commit -m "Describe what you changed in one line."
```

Example:

```
git commit -m "Add one-click Connect browser for extension setup."
```

Step 4 - Push to GitHub

```
git push origin main
```

Verify: <https://github.com/ICITPROJ/Fortiva/commits/main>

Step 5 (optional) - Publish an app update

Pushing main alone does NOT update installed Fortiva apps. To ship an update users can install via Check

for updates:

```
.\scripts\publish-release.ps1
```

That script pushes main, creates a version tag from Directory.Build.props, and triggers the Release workflow.

Watch the build: <https://github.com/ICITPROJ/Fortiva/actions>

When the workflow is green, users can use Settings -> Check for updates in the app.

Quick copy-paste (normal day)

```
cd C:\Repo\Github\Fortiva
git status
git add -A
git commit -m "Your message here"
git push origin main
```

Which repository?

- App (this folder): github.com/ICITPROJ/Fortiva
- Website (separate project): github.com/ICITPROJ/Fortiva-Website

Push Fortiva for the desktop app - not Fortiva-Website.

What each stage affects

- Uncommitted edits: your PC only - nothing on GitHub
- Committed, not pushed: still your PC only
- Pushed to main: GitHub repo updated; CI runs tests
- Tag pushed (e.g. v1.0.5): Release workflow builds installers + update manifest
- Check for updates in app: pulls from GitHub Releases, not from main
